African American Women’s Birth Stories as Told to African American Women Interviewers

Tamiah McCoy, SN; Leona VandeVusse, PhD, RN, CNM, FACNM; Lisa Hanson, PhD, RN, CNM, FACNM

McNair Scholars Program 2013
Marquette University College of Nursing
Despite record healthcare spending, health inequalities exist in the USA.

Mortality disproportionately impacts African American (AA) childbearing families compared to Caucasian.

>2 times as many AA infants become ill or die in first year of age.

Nearly 3 times as many AA women die of pregnancy related causes.
AA women are marginalized
Their experiences of healthcare may provide insights to improve outcomes
Birth stories give voice to AA women’s experiences; providers can listen & learn

Validity: Women can still recall explicit details 20 or more years after childbirth

AA women telling their birth stories to female AA researchers may identify gaps in care & that could provide new insights into health disparities
Absence of research on AA women’s birth stories

AA patients with same race healthcare providers report being more satisfied and involved in their healthcare visits (Cooper, Roter, Johnson, Ford, Steinwachs, & Powe, 2003)

Health disparities can be impacted by clinical interventions that may seem trivial or are often overlooked (Cox, 2009)
To reexamine birth stories of AA women, as told to AA nurse researchers, to learn and gain new insights that could be used to improve care and outcomes
Research Questions

- What can birth stories tell us about the experiences AA women have during their labors and births?
- What can healthcare providers learn from AA women’s birth stories to improve care?
Methods

- **Design:** Secondary qualitative analysis
- **Procedure:** 5 randomly selected transcripts were re-analyzed to obtain a deeper understanding of each story.
- **Sample:** 5 transcribed interviews of AA women disclosing their birth stories to female AA nurse researchers in 2001
**Demographics**

All 5 women had normal vaginal births [total of 7]

Data Analysis

- Initial coding identified keywords & common phrases
- Analysis progressed to identifying vignettes, outliers, & underlying concepts
- Review of audit trails & coding notes with mentors resulted in identification of 3 themes
Theme 1: Desire for Continuous Labor Support

“Who’s going to be here when the baby comes? I was so mad when she [the nurse] left.”

“I am not saying that they [nurses] have to stay for everyone, but they should be assigned to patients and then should stay with them.”
Theme 2: Preference for Certain Provider Characteristics

- Nursing background: “He [MD] wasn’t there in the beginning, but when I started crowning I guess that’s when he came. That’s the difference between him and [name of CNM]. [CNM] was there when I went in.”

- AA: “We have a trust and a bond thing because it’s a race thing, so I feel comfortable with a black doctor…I just think black women and white women have different issues with their bodies and she is just more in tune with me, we can relate to some of the things that are going on.”

- Female: “…but by being a woman I believe she [CNM] had more sympathy.”
“I prayed about it and I was assured that my baby was going to be fine.”

“…they told me she wasn’t going to make it to one years old and you know it really did get me because she was born small and…God fixed it…”
Nursing Implications

- Nurses need to be available and work toward continuous presence with laboring women.
- AA female healthcare providers of nursing may be able to better secure a bond and trust with their AA female patients; therefore, more efforts to promote healthcare as a career for AAs are warranted.
- Healthcare providers need to be more aware, accepting, and encouraging of the spiritual needs of laboring women.
Suggestions for Future Research

- Analyze current birth stories told by AA women
- Use a larger sample size of birth stories
- Consider impacts of multiple characteristics of providers, including gender and race, and other factors, such as spirituality and presence, identified as important in AA women’s birth stories told to AA female interviewers
Conclusion

- Listening to and learning from AA women’s birth stories may provide new insights for care providers.
- Honoring AA women’s perspectives on birthing may assist in addressing health disparities in AA birth outcomes.
