Abstract

Treatment of $\text{Mn}_2(\text{CO})_{10}$ with 2-thiazoline-2-thiol in the presence of Me_3NO at room temperature afforded the dimanganese complexes $[\text{Mn}_2(\text{CO})_7(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ (**1**) and $[\text{Mn}_2(\text{CO})_6(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ (**2**) in 51 and 34% yields, respectively. Compound **1** was quantitatively converted into **2** when reacted with one equiv of Me_3NO . Reaction of **1** with triphenylphosphine at room temperature furnished the mononuclear complex $[\text{Mn}(\text{CO})_3(\text{PPh}_3)(\kappa^2\text{-NS}_2\text{C}_3\text{H}_4)]$ (**3**) in 66% yield. All three new complexes have been characterized by elemental analyzes and spectroscopic data together with single crystal X-ray diffraction studies for **1** and **3**. Compound **1** crystallizes in the orthorhombic space group $Pbc\bar{a}$ with $a = 12.4147(2)$, $b = 16.2416(3)$, $c = 19.0841(4)$ Å, $\theta = 90^\circ$, $Z = 8$ and $V = 3848.01(12)$ Å³ and **3** crystallizes in the monoclinic space group $P\ 2_1/n$ with $a = 10.41730(10)$, $b = 14.7710(2)$, $c = 14.9209(2)$ Å, $\theta = 91.1760(10)^\circ$, $Z = 4$ and $V = 2295.45(5)$ Å³.

Graphical Abstract

Two new dimanganese complexes $[\text{Mn}_2(\text{CO})_7(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ (**1**) and $[\text{Mn}_2(\text{CO})_6(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ (**2**) were formed when $[\text{Mn}_2(\text{CO})_{10}]$ was treated with 2-thiazoline-2-thiol in the presence of Me_3NO . Compound **2** reacts with PPh_3 to give the monomeric complex $[\text{Mn}(\text{CO})_3(\text{PPh}_3)(\kappa^2\text{-NS}_2\text{C}_3\text{H}_4)]$. The structures of **1** and **3** were established by crystallography. Shishir Ghosh, Faruque Ahmed, Rafique Al-Mamun, Daniel T. Haworth, Sergey V. Lindeman, Tasneem A. Siddiquee, Dennis W. Bennett, Shariff E. Kabir Investigations of 2-thiazoline-2-thiol as a ligand: Synthesis and X-ray structures of $[\text{Mn}_2(\text{CO})_7(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ and $[\text{Mn}(\text{CO})_3(\text{PPh}_3)(\kappa^2\text{-NS}_2\text{C}_3\text{H}_4)]$.

Manganese, Carbonyl, 2-Thiazoline-2-thiol, X-ray structures

Introduction

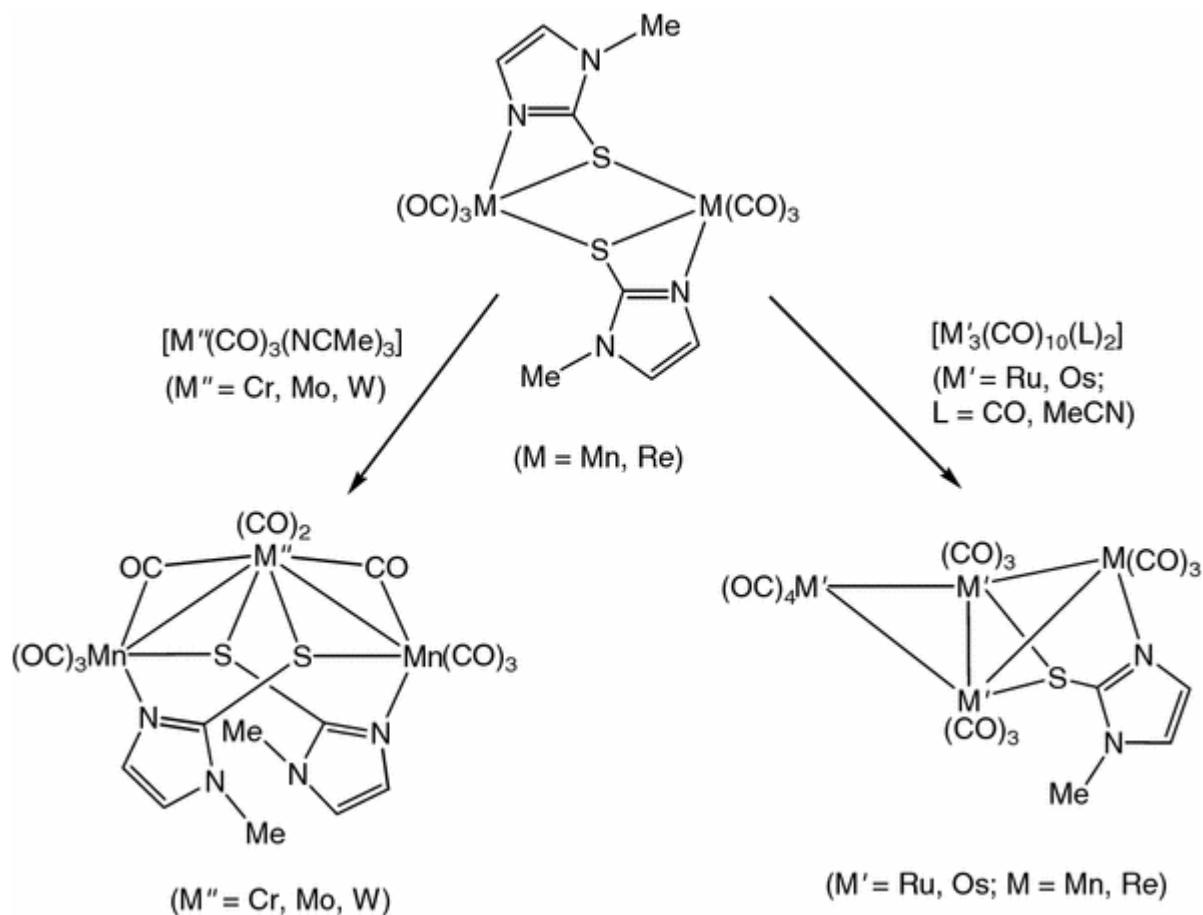

The study of the reactivity of nitrogen and sulfur containing small heterocyclic organic molecules towards transition metal carbonyl clusters has attracted considerable interest because such ligands frequently stabilize the metal cluster framework by serving as chelating or bridging ligands^{1,2,3,4,5} and also due to their potential applicability in modeling hydrodenitrogenation (HDN) and hydrodesulfurization (HDS) processes.^{1,2,3,4,5,6,7} These reactions are usually accompanied by C–H, N–H, S–H and C–N bonds activation of the heterocyclic ligand and markedly influenced by the structure of the heterocycle as well as the reaction conditions and starting complexes. We have previously investigated the reactions of pyridine-2-thiol,⁸ pyrimidine-2-thiol,⁸ thiazole,^{9,10} 4-methylthiazole,¹¹ thiazolidine,⁷ thiomorpholine,⁷ benzothiazole,⁶ and benzimidazole-2-thiol⁶ with osmium and ruthenium carbonyl clusters and observed that the type of products obtained in these reactions are

remarkably influenced by the intrinsic reactivity of the metal carbonyl clusters, the heterocyclic ligands and the reaction conditions.

The reactions of heterocyclic thiols with group seven metal carbonyls are also influenced by the structure of the heterocyclic ligands as well as by the intrinsic reactivity of the metal carbonyls. For example, pyridine-2-thiol^{12,13} reacts with $M_2(CO)_{10}$ ($M = Mn, Re$) to give the dimeric complex $[M_2(CO)_6(\mu\text{-NSC}_5H_4)_2]$ ($M = Mn, Re$), whereas, pyrimidine-2-thiol¹⁴ affords the tetrameric complex $[M_4(CO)_{12}(\mu\text{-SN}_2C_4H_3)_4]$ ($M = Mn, Re$) exclusively (Scheme 1). We have recently shown that the five-membered heterocyclic thiol 2-mercaptopro-1-methylimidazole reacts with $Mn_2(CO)_{10}$ to give the dimer $[Mn_2(CO)_6(\mu\text{-N}_2SC_4H_5)_2]$, while with $Re_2(CO)_{10}$ the di-, tri- and tetramer products: $[Re_2(CO)_6(\mu\text{-N}_2SC_4H_5)_2]$, $[Re_3(CO)_8(\mu\text{-CO})(\mu\text{-N}_2SC_4H_5)_2(\mu\text{-H})]$ and $[Re_4(CO)_{12}(\mu\text{-N}_2SC_4H_5)_4]$ were obtained.¹⁵ The products isolated from these reactions not only show unique structural features, but also prove to be useful precursors for the synthesis of a wide variety of mixed-metal complexes.^{14,15,16,17} For example, the trimetallic mixed-metal complexes of the general formula $[MMn_2(CO)_8(\mu\text{-CO})_2(\mu\text{-N}_2SC_4H_5)_2]$ ¹⁵ ($M = Cr, Mo, W$) were obtained from the reaction between $[M(CO)_3(NCMe)_3]$ ($M = Cr, Mo, W$) and the dimanganese complex $[Mn_2(CO)_6(\mu\text{-NSC}_4H_5)_2]$ in which the three metal atoms are linked by two M–Mn bonds, two $\mu\text{-N}_2SC_4H_5$ ligands and two $\mu\text{-CO}$ groups, whereas, $[M'{}_3(CO)_{10}(L)_2]$ ($M' = Ru, Os$; $L = CO, MeCN$) and $[M_2(CO)_6(\mu\text{-N}_2SC_4H_5)_2]$ ($M = Mn, Re$) furnished the tetranuclear mixed-metal butterfly clusters of the general formula $[M'{}_3M(CO)_{13}(\mu\text{-N}_2SC_4H_5)]$ ¹⁷ ($M' = Ru, Os$; $M = Mn, Re$) in which the single atom occupies a wingtip position (Scheme 2).

Scheme 1

Scheme 2

However, the reactivity of all these heterocyclic thiols so far studied is aromatic. In order to investigate the difference in reactivity and product distribution in the absence of aromaticity within the heterocyclic ring, we examined the reactivity of 2-thiazoline-2-thiol towards $Mn_2(CO)_{10}$ and the results of this study are reported in the present paper.

Experimental

All reactions were performed under a nitrogen atmosphere using standard Schlenk techniques unless otherwise noted. Reagent-grade solvents were dried by standard procedures and were distilled from appropriate drying agents prior to use. Infrared spectra were recorded on a Shimadzu FTIR 8101 spectrophotometer. NMR spectra were recorded on a Bruker DPX 400 instrument. Mass spectra were recorded on a Varian Mat 312 mass spectrometer. Elemental analyses were performed by BCSIR Laboratories, Dhaka. $Mn_2(CO)_{10}$ was purchased from Strem Chemical Inc. and used without further purification. 2-Thiazoline-2-thiol was purchased from Aldrich and used as received.

Reaction of Mn₂(CO)₁₀ with 2-Thiazoline-2-thiol in the Presence of Me₃NO

A CH₂Cl₂ solution (40 mL) of Mn₂(CO)₁₀ (401 mg, 1.03 mmol), 2-thiazoline-2-thiol (245 mg, 2.06 mmol) and Me₃NO (155 mg, 2.07 mmol) was stirred at room temperature for 48 h. The solvent was removed in vacuo and the residue chromatographed by TLC on silica gel. Elution with hexane/acetone (7:3, v/v) developed two bands. The faster moving band gave [Mn₂(CO)₇(μ-NS₂C₃H₄)₂] (**1**) (283 mg, 51%) as yellow crystals, while the slower moving band afforded [Mn₂(CO)₆(μ-NS₂C₃H₄)₂] (**2**) (179 mg, 34%) as orange crystals after recrystallization from hexane/CH₂Cl₂ at 4 °C. Spectral data for **1**: Anal. Calcd. for C₁₃H₈Mn₂N₂O₇S₄: C, 28.79; H, 1.49; N, 5.17. Found: C, 28.95; H, 1.63; N, 5.28%. IR (ν_{CO}, CH₂Cl₂): 2,089 m, 2,038 s, 2,029 vs, 2,018 vs, 2,008 vs, 1,964 s, 1,941 vs, 1,924 s cm⁻¹. ¹H NMR (CDCl₃): δ 4.32 (s, 1H), 4.13 (s, 1H), 3.96 (s, 1H), 3.74 (s, 2H), 3.47 (s, 1H), 3.33 (s, 2H); mass spectrum: *m/z* 542 (M⁺), 514 (M⁺-CO), 486 (M⁺-2CO), 458 (M⁺-3CO), 430 (M⁺-4CO), 402 (M⁺-5CO), 374 (M⁺-6CO), 346 (M⁺-7CO). Spectral data for **2**: Anal. Calcd. for C₁₂H₈Mn₂N₂O₆S₄: C, 28.02; H, 1.57; N, 5.45. Found: C, 28.25; H, 1.63; N, 5.59%. IR (ν_{CO}, CH₂Cl₂): 2,089 w, 2,039 s, 2,020 vs, 1,939 vs (br) cm⁻¹. ¹H NMR (CDCl₃): δ 3.81 (s, 4H), 3.38 (s, 4H); mass spectrum: *m/z* 514 (M⁺), 486 (M⁺-CO), 458 (M⁺-2CO), 430 (M⁺-3CO), 402 (M⁺-4CO), 374 (M⁺-5CO), 346 (M⁺-6CO).

Conversion of **1** into **2**

To a CH₂Cl₂ solution (20 mL) of **1** (50 mg, 0.092 mmol) was added Me₃NO (7 mg, 0.093 mmol) and the mixture was stirred at room temperature for 24 h. The solvent was removed under reduced pressure and the residue chromatographed by TLC on silica gel. Elution with hexane/acetone (7:3, v/v) developed only one band, which gave **2** (42 mg, 89%) as orange crystals after recrystallization from hexane/CH₂Cl₂ at 4 °C.

Reaction of **2** with triphenylphosphine (PPh₃)

PPh₃ (102 mg, 0.389 mmol) was added to a CH₂Cl₂ solution (30 mL) of **2** (100 mg, 0.195 mmol) and the mixture was stirred at room temperature for 72 h. The solvent was removed by rotary evaporation and the residue chromatographed by TLC on silica gel. Elution with hexane/acetone (1:1, v/v) developed one major and several minor bands. The major band gave **3** (134 mg, 66%) as yellow crystals after recrystallization from hexane/CH₂Cl₂ at 4 °C while the content of the minor bands were too small for characterization. Spectral data for **3**: Anal. Calcd. for C₂₄H₁₉MnNO₃PS₂: C, 55.49; H, 3.69; N, 2.69. Found: C, 55.76; H, 3.75; N, 2.82%. IR (ν_{CO}, CH₂Cl₂): 2,022 vs, 1,941 s, 1,907 s cm⁻¹. ¹H NMR (CDCl₃): δ 7.60 (br. s, 6H), 7.38 (br. s, 9H), 3.39 (s, 1H), 3.25 (s, 1H), 2.99 (s, 1H), 2.48 (s, 1H); ³¹P-{¹H} NMR (CDCl₃): δ 59.0 (s); mass spectrum: *m/z* 519 (M⁺), 491 (M⁺-CO), 463 (M⁺-2CO), 435 (M⁺-3CO).

X-ray Crystallography

Single crystals were mounted on fibers and diffraction data were collected at low temperature (see Table [1](#)) on a Bruker AXS SMART APEX CCD diffractometers using Cu-Kα radiation (λ = 1.54178 Å). Data collection, indexing and initial cell refinements were all done using SMART¹⁸ software. Data reduction was accomplished with SAINT¹⁹ software and the SADABS program²⁰ was used to apply

empirical absorption corrections. The structures were solved by direct methods²¹ and refined by full-matrix least-squares.²² All non-hydrogen atoms were refined anisotropically and hydrogen atoms were included using a riding model. Scattering factors were taken from International Tables for X-ray Crystallography.²³ Additional details of data collection and structure refinement are given in Table 1.

Results and Discussion

The reaction of $\text{Mn}_2(\text{CO})_{10}$ with 2-thiazoline-2-thiol in the presence of Me_3NO at room temperature, followed by usual workup and chromatographic separation, afforded two dimanganese complexes, $[\text{Mn}_2(\text{CO})_7(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ (**1**) and $[\text{Mn}_2(\text{CO})_6(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ (**2**) in 51 and 34% yields, respectively. Compound **1** converted into **2** in 89% yield when a CH_2Cl_2 solution of the former was treated with equivalent amount of Me_3NO (Scheme 3). These new compounds were characterized by elemental analysis, IR, ^1H NMR and mass spectral data together with single crystal X-ray diffraction studies for **1**.

Scheme 3

An ORTEP diagram of the molecular structure of **1** is depicted in Fig. 1 and selected bond lengths and angles are listed in Table 2. The structure of compound **1** is analogous to the 2-mercaptop-1-methylimidazole analog [$\text{Mn}_2(\text{CO})_7(\mu\text{-SN}_2\text{C}_4\text{H}_5)_2$] previously reported.¹⁵ The molecule consists of a dinuclear framework of two manganese atoms ligated by seven carbonyl and two 2-thiazoline-2-thiolato ligands. The seven carbonyl ligands are all terminal: three of which are bonded to $\text{Mn}(1)$ and four to $\text{Mn}(2)$ such that the molecule contains one $\text{Mn}(\text{CO})_3$ and one $\text{Mn}(\text{CO})_4$ groups which are linked by two bridging 2-thiazoline-2-thiolato ligands. The coordination modes of the heterocyclic ligands in the molecule are different. One bridges the two manganese centers through the exo-sulfur atom, while forming a four-membered chelate ring by coordinating through the nitrogen atom. The $\text{N}-\text{Mn}-\text{S}$ angle within the chelate ring is $68.12(5)^\circ$ which is very close to that observed in $[\text{Mn}_2(\text{CO})_7(\mu\text{-SN}_2\text{C}_4\text{H}_5)_2]$ ($69.1(2)^\circ$). Other bridges the two manganese centers using the nitrogen and the exo-

sulfur atoms that are coordinated to different metal centers. Thus one heterocyclic ligand acts as a five electron donor whereas the other donates three electrons to the metal centers. The coordination geometry around each manganese center can be rationalized as a distorted octahedron which is evident from the short S(1)–Mn(2)–S(3) and N(1)–Mn(1)–S(1) angles {88.40(2) and 68.12(5) $^{\circ}$ }. The *trans* angles about the manganese centers range from 167.49(7) $^{\circ}$ to 178.27(7) $^{\circ}$. The Mn–S bond distances ranging from 2.3771(6)–2.4495(6) Å can be regarded as Mn–S single bonds. The av. Mn–C and av. Mn–N bond distances in **1** {1.831(2) and 2.060(18) Å} are similar to those observed in $[\text{Mn}_2(\text{CO})_7(\mu\text{-SN}_2\text{C}_4\text{H}_5)_2]$ {1.811(9) and 2.057(8) Å}. The geometries of the heterocyclic ligands do not seem to be substantially distorted by coordinating to the metal centers. The Mn···Mn distance of 4.175(1) Å is clearly a non-bonding distance and according to the electron counting procedures, each manganese atom achieves an 18-electron configuration without a metal–metal bond. The spectroscopic data of compound **1** are consistent with the solid-state structure. The infrared spectrum in the carbonyl stretching region shows absorption bands above 1,900 cm $^{-1}$ indicating that all carbonyl groups are terminal. The ^1H NMR spectrum displays two sets of resonances: four singlets at δ 4.32, 4.13, 3.96 and 3.47 (each integrating to 1H) and two singlets at δ 3.74 and 3.33 (each integrating to 2H). However, from this study it is not possible to assign these resonances to the particular thiol moieties unambiguously. We assume that the four singlets appear due to the hydrogen atoms of one 2-thiazoline-2-thiolato ligand while the doublets appear for the hydrogen atoms of the other 2-thiazoline-2-thiolato ligand. The FAB mass spectrum exhibits the parent molecular ion peak at m/z 542 and peaks due to the sequential loss of seven CO ligands which supports the solid-state structure.

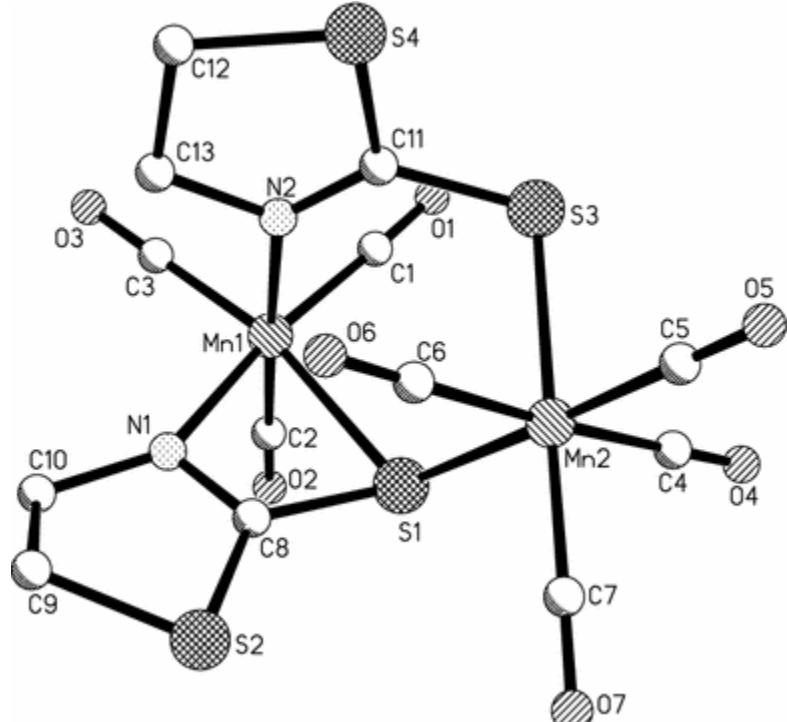

Fig. 1. X-ray structure of $[\text{Mn}_2(\text{CO})_7(\mu\text{-NS}_2\text{C}_3\text{H}_4)_2]$ (**1**) showing the atom labeling scheme used. Hydrogen atoms are omitted for clarity. Thermal ellipsoids are drawn at 50% probability level

Compound **2** is straightforwardly characterized by comparison of the spectroscopic data with those of the structurally characterized similar dimanganese complexes $[\text{Mn}_2(\text{CO})_6(\mu\text{-SN}_2\text{C}_4\text{H}_5)_2]$,¹⁵ $[\text{Mn}_2(\text{CO})_6(\mu\text{-SNC}_5\text{H}_4)_2]$ ¹² and $[\text{Mn}_2(\text{CO})_6(\mu\text{-SN(Me)C}_5\text{H}_3)_2]$.¹² The infrared spectrum of **2** in the carbonyl stretching region is very similar to those observed for $[\text{Mn}_2(\text{CO})_6(\mu\text{-SN}_2\text{C}_4\text{H}_5)_2]$,¹⁵ $[\text{Mn}_2(\text{CO})_6(\mu\text{-SNC}_5\text{H}_4)_2]$ ¹² and $[\text{Mn}_2(\text{CO})_6(\mu\text{-SN(Me)C}_5\text{H}_3)_2]$,¹² indicating that they are isostructural. The FAB mass spectrum shows the parent molecular ion peak at m/z 514 and peaks due to successive loss of six CO ligands. The ^1H NMR spectrum displays two equal intensity singlets at δ 3.81 and 3.38 as expected for the two equivalent 2-thiazoline-2-thiolato ligands^{12,15} which are also consistent with the proposed structure.

Treatment of complex **2** with PPh_3 at room temperature gave the monomeric complex *fac*- $[\text{Mn}(\text{CO})_3(\text{PPh}_3)(\kappa^2\text{-NS}_2\text{C}_3\text{H}_4)]$ (**3**) in 66% yield (Scheme 3). The infrared spectrum shows three strong νCO absorption bands [CH_2Cl_2 : 2,022 vs, 1,941 s, 1,907 s cm^{-1}] which support the facial configuration of **3**.^{12,24} The FAB mass spectrum exhibits a parent molecular ion peak at m/z 519 together with fragmentation peaks due to stepwise loss of three CO ligands. An ORTEP diagram of the molecular structure of **3** is shown in Fig. 2 and selected bond angles and distances are collected in Table 3. The molecule contains a single manganese atom with three carbonyl groups, a chelating 2-thiazoline-2-thiolato ligand and a triphenylphosphine ligand. The coordination geometry around manganese atom is a distorted octahedron with three carbonyl groups arranged in a facial fashion. The main distortion of the ideal octahedral geometry is due to the short bite angle of the chelating 2-thiazoline-2-thiolato ligand {68.29(5) $^\circ$ }. Within the molecule, the coordinated nitrogen and sulfur atom of the chelating ligand and the carbon atoms of the two CO ligands {C(2) and C(3)} constitute the best equatorial plane around the metal center with small deviation from planarity. The manganese atom is located in this plane and the PPh_3 ligand occupies an axial site with respect to this plane. The *trans* angles about the metal center range from 162.82(7) $^\circ$ to 178.30(6) $^\circ$. Compound **3** is structurally similar to *fac*- $[\text{Mn}(\text{CO})_3(\text{PPh}_3)(\kappa^2\text{-SN}_2\text{C}_4\text{H}_3)]$ ¹⁴ obtained from the reaction between $[\text{M}_4(\text{CO})_{12}(\mu\text{-SN}_2\text{C}_4\text{H}_3)_4]$ and triphenylphosphine. The Mn–N, Mn–S and av. Mn–C bond distances in **3** {2.0493(16), 2.4434(6) and 1.819(2) Å} are similar to those observed *fac*- $[\text{Mn}(\text{CO})_3(\text{PPh}_3)(\kappa^2\text{-SN}_2\text{C}_4\text{H}_3)]$ ¹⁴ and related complexes found in literature.^{12,14,15,17} In addition to usual aromatic resonances for the phenyl protons of the PPh_3 ligand, the aliphatic region of the ^1H NMR spectrum displays four singlets at δ 3.39, 3.25, 2.99 and 2.48 while the ^{31}P -{ ^1H } NMR spectrum displays a singlet at δ 59.0 for the phosphorus atom of the PPh_3 ligand which is consistent with the solid-state structure.

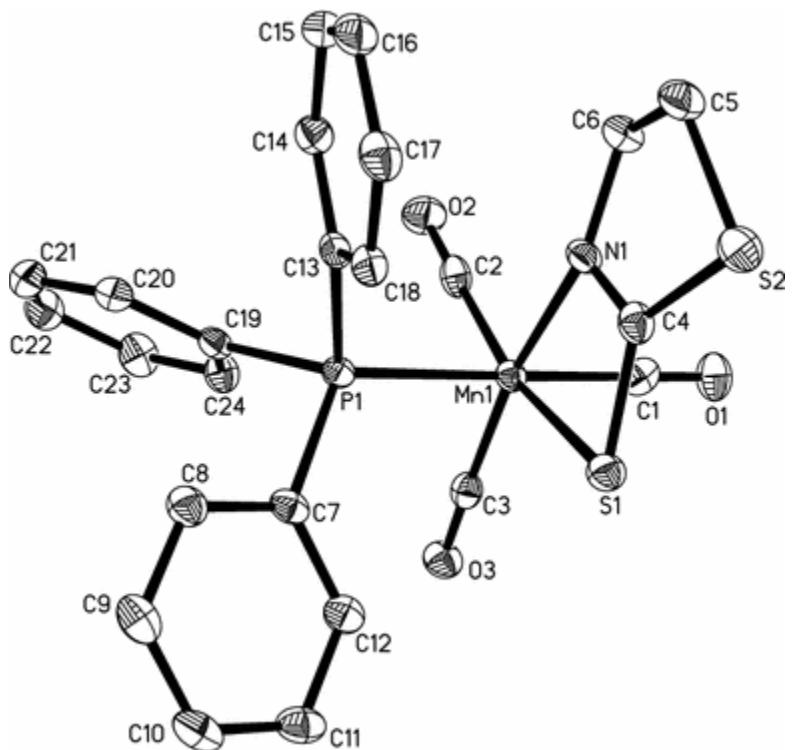

Fig. 2. X-ray structure of $[\text{Mn}(\text{CO})_3(\text{PPh}_3)(\kappa^2\text{-NS}_2\text{C}_3\text{H}_4)]$ (**3**) showing the atom labeling scheme used. Hydrogen atoms are omitted for clarity. Thermal ellipsoids are drawn at 50% probability level

Table 3. Selected bond distances (Å) and angles (°) for **3**
