Who Speaks for the Fetus

Eugene F. Diamond, M.D.

To speak for the fetus and to be his advocate is an appropriate assignment for a pediatrician. In keeping with the current modern trend in the relationship between obstetrician and the pediatrician, the obstetrician now recognizes that he is responsible for two patients, the mother and her unborn child.

To consider the fetus not to be a separate person but merely a part of the mother has not been tenable since the sixteenth century when Arantius showed that the maternal and fetal circulations were separate—neither continuous nor contiguous. The determination and completeness of life requires only time and nutrition. Only two possible futures are open to it. It can be a figure of God or a misnomer since no one could possibly consult and decide whether to preserve the child or not. It is not surprising that this question is a misnomer since no one could possibly consult and decide whether to preserve the mother's life or preserve the life of the fetus. The situation of maternal rubella during the first trimester, modern prospective, virologically controlled studies indicate that no more than 20% of fetuses will be at risk (2). Even a figure of 20% would have to include such anomalies as remeasurable cardiac defects, tonal hearing loss and intrauterine growth retardation. When one talks of severe life-blighting congenital anomalies due to German measles, he is talking about cataracts and mental retardation. The risk of an infant suffering one of these calamities is much less than 10%. In fact, an eleven year prospective followup of offspring born to mothers contracting German measles during the first 16 weeks of pregnancy showed their intelligence distribution to be normal (3). The risk of an infant being born with any type of congenital anomaly is much less in any non-epidemic year than it is during a rubella epidemic (5). Since Mayer and Parkman (6) of the National Institute of Health have already reported on field trials of an apparently potent Rubella vaccine, it is likely that a vaccine will be available before the next rubella epidemic occurs, since epidemics usually occur every five to seven years. The answer to the rubella dilemma lies in this vaccine and not in therapeutic abortion.

The problem of teratogenic drug ingestion would also seem irrelevant in this context. Thalidomide was not on the American Market. It is unlikely that a drug with such a teratogenic capability could pass the progeny study requirements now made mandatory by the Food and Drug Administration. Indeed, progeny studies on the rat and more recently on the baboon (7) have produced limb bud anomalies in animal fetuses almost identical to the phocomelia seen in human beings. The Thalidomide tragedy was, in a sense, iatrogenic and, therefore, deserving of our profession's utmost concern and compassion. In keeping with noblest medical traditions is the work of Dr. Gustav Hauber of the Anna Stift rehabilitation school in Hanover, Germany. In this institution, a team of orthopedists, social workers, and teachers have been engaged in the developing of abilities of Thalidomide-damaged children so that, despite their heavy handicaps, they will still value life. Mental and psychological development has been normal, in most cases, and higher education potential is attributed to most. Thus even such a poignant situation as the birth of 7,000 phocomelics can have its positive aspect when medical resources are properly mobilized. The best preventative against the recurrence of such a tragedy is the basic reluctance of obstetricians to give any new drugs to pregnant women.
It is difficult to formulate a therapeutic principle which would apply to the various situations by exposure to drugs or disease. If the principle is that it is better for eight or nine normal babies to die than for one or two abnormal babies to be born, then I must say that I reject this principle as wasteful and unreasonable. It seems to me that this viewpoint derives from a cult of perfection which says that life is not worth living unless it is free of handicaps. That vita is not vita unless it is La Dolce Vita (8). Experience in working with handicapped children would suggest that human nature frequently rises above its impediments and that, in Shakespeare's words, "Best men are molded out of faults and, for the most, become much more the better for being a little bad".

Certainly the entire medical profession, not just abortion-law revisionists, has compassion for victims of forcible rape and incest. There is a question, however, as to the true implications of this problem. Studies on human fertility would suggest that not too many pregnancies are likely to result from a single act of forcible rape. I am informed, by the local states attorneys office that their staff could not recall a single incident of such a pregnancy in an experience covering about nine years of prosecutions for rape. If such a pregnancy were to occur, there is no evidence that psychological trauma would be prevented, unaffected, or intensified by compounding the shame of rape with the possible guilt of abortion. In the case of statutory rape, there is likewise a question as to the relevance of therapeutic abortion. Teenage girls who become pregnant are largely a group characterized by social isolation and alienation from their parents. Frequently, they look forward to the birth of an infant as a further loneliness compensation and, therefore, do not present themselves for therapeutic abortion consideration. Incestuous pregnancy is more difficult to prove, and the pregnancies are not recognized or admitted until physically obvious and beyond the time when abortion would be possible. Many cases of alleged incest will fail of recognition because the victim or her mother will shrink from the financial ruin involved is accusing the father or the social ruin involved in convicting a brother. In 1966, there were only two indictments of a case involving pregnancy in Cook County and only a fraction of these involved pregnancies to which therapeutic abortion would have related under any law.

Much is made of the appeal to prevent the birth of unwanted children. It seems to me that there is a confusion here which results from the failure to distinguish between the unwanted child and the unwanted pregnancy. In fifteen years of experience with the parent-child relationship, I have very rarely encountered a mother who asked to be rid of her child unless she had taken it home from the nursery. I have encountered many mothers, pregnant with their third or fourth child who undergo a kind of panic which sequent feelings sympathetic support of their doctor and their husband. According to Hoerck, 75% of women who were refused abortion under the Swedish system, went on to have their babies and were happy with them. According to Aten and Narzak, more of these women have an improvement in their mental adjustment than a deterioration of mental health. I wonder if we really want a situation like that in Denmark for example where the principal indications for abortions (1) the housewife syndrome of insufficiency and 3) impending exhaustion (11).

One of the unanswerable risks of medical practice is that we sometimes begin to believe in the phantasies of our patients. Patients may ascribe god-like qualities to us but I doubt that they will approve of our acting them out. The notion that a physician should be allowed to perform any abortion he chooses within the framework of the physician-patient relationship is a unique and unprecedented request for any profession. Does the lawyer ask that since law is his specialty, laws should be left to his conscience? Does the educator suggest that his position as an educator entitles him to decide when prayer should occur in public schools? A doctor may know how to do an abortion, he does not necessarily know when it should be done or if it should be done at all.

Ninety percent of abortions in the United States are performed on women who are married, healthy, and living with their husbands. Ninety-five percent of the fetuses destroyed in these abortions would have been born normal. If we accept the Kinsey statistics, 88.95% of abortions are performed by technically competent doctors of medicine. What do we expect to gain, then, from changing the law?

It seems ironic that when we have established a National Institute of Child Health which specifically directs its attention to child development from the time of conception and while tens of millions are being spent by various national foundations to improve the lot of the unborn, that we should see in this day a movement for more liberal "fetal indications" for abortion.

If you ask me therefore to speak for the fetus, then speak for him I will. I speak for him intact or deformed. I speak for him wanted or unwanted.
Yes, and I speak for him be he illegitimate or high-born. I am for life and the preservation of life. I believe that any life is of infinite value and that this value is not significantly diminished by physical or mental defect or the circumstances of that life’s beginning. I believe that this regard for the quantity and the quality of life is a cornerstone of Western culture. I believe our patients are served best by a medico-ethical which also holds this principle sacred.

Address to Canon Law Society

Richard Cardinal Cushing

(Editor’s Note: This talk was delivered at the 30th annual meeting of the Canon Law Society of America in Boston, Mass., September 11, 1968.

Since this applies to doctors as well as priests, we have included it in this issue of ‘L.Q.W.I.E.’)

Most of us here tonight are priests of God and men dedicated and committed to the teaching, to the interpretation, to the application and to the implementation of law. We must be, by reason of our ministry and special calling, respecters of the law. By our example of respect and by reason of our dedicated obedience we can and we shall encourage the Christian community and the People of God to observe and to obey the law conscientiously. The laity become confused and scandalized when they observe willful and deliberate violation of the law on the part of those, who, by reason of their vocation, should be its respecters.

Even when it appears that some worthwhile and immediate good could be achieved by violation of law, the long-term result is apt to be scandalous and disastrous. Disrespect for law by those who should have a special commitment to it, will certainly be the breeding ground of indifference to law on the part of our people.

There is no justification for those among us who take the law into their own hands, who disobey or violate the law, who create and fashion a law unto themselves, or who consider their ideas and programs and ultimate goals above and beyond the law. Good faith and well-intentioned activity cannot excuse. Impatience to change a law or procedure — however well-founded — cannot justify its infraction. Strive to change a law that needs changing — by all means — but obey it until it is changed. Be consistent at all times and under all circumstances.

We note that our Church structure and our theology and our system of law have been described as formalistic, legalistic, casuistic, and unduly concerned over hair-splitting and intricate distinctions. Yet, it is noteworthy that some of those who have thus described our systems are very quick to take refuge in distinctions and legalism, when it appears to favor their position or is helpful in explaining and justifying their point of view.
